

OLSR for Android

The trick is to use the wpa-suppllication settings file to force the driver to go to ad-hoc mode. By the default the tiwlan cmd line utility does not understand ad-hoc mode.

1. turn on Wi-Fi and start the [adb shell](#)
2. go to wpa_cli command shell:

```
su -c "/system/bin/wpa_cli -p /data/misc/wifi/"
```
3. scan_results shows you the existing networks.
4. add_network add a new network. Shows a number. Here the number is "2"
5. set_network 2 mode 1

```
set_network 2 ssid "olsr.freifunk.net"
set_network 2 bssid 02:ca:ff:ee:ba:be
set_network 2 frequency 2457
set_network 2 key_mgmt NONE
enable_network 2
```
6. ap_scan 2
7. select_network 2
8. if this did not work, then try again: ap_scan 2
9. This is now what you get:

```
su -c "/system/bin/wpa_cli -p /data/misc/wifi/"
wpa_cli v0.5.10
Copyright (c) 2004-2008, Jouni Malinen and contributors
```

Installing Olsr

1. The latest release is 0.6.0. Fetch the latest release from <http://www.olsr.org/?q=download>.
2. Unpack, compile and install the source code:

```

# tar jxvf olsrd-x.y.z
# cd olsrd-x.y.z
# make build_all
# make install_all

```

3. The **olsrd** gets installed to /usr/bin/
4. Follow the instructions at the end of the installation.

Starting olsr

From the Terminal or adb shell: `olsrd -f /data/local/etc/olsrd.conf -d 1`. You should see some routes in your kernel routing table if you are connected to an ad-hoc network which has other olsr nodes.

Credits: thanks to Sven-Ola Tücke for finding all this out!
